

**SPCA ANIMAL HOSPITAL  
CLINIC RECORD**

COPY

VILLAGE ID: 301800 - Xena  
 ADMITTED: 24 JAN 2019  
 ENTRY TYPE: SEIZED  
 STATUS: UNDER INVESTIGATION  
 LOCATION: FOSTER HOME GENERAL

**ANIMAL DETAILS**

**NAME:** Xena **SEX:** Female  
**SPECIES:** Dog **DESEXED:** Not Desexed  
**BREED:** Shepherd, German **AGE:** 4 - 5 Years (at admission)  
**COLOUR:** Black/Tan / Black/Tan **MICROCHIP ID:** 900108001577500  
**FEATURES:** **ENTRY NOTES:** Inspector Instructions: hold - monitor - weight

**OTHER ADMISSION DETAILS**

**JND:** Miranda **ENTRY SOURCE:** Inspector  
**UPLIFT INFO:** Lori Davis - UPLIFT SCREEN - Underweight. Vet to assess  
**MANAGER ALERT:**  
**MEDICAL ALERT:** VD pelvis: Mild femoral head flattening and mildly dysplastic hip on right side.  
 Left and right elbow laterals: Mild arthritic changes (proximal tibia) right elbow. Left elbow appears normal.  
 No treatment required at this stage unless clinically lame/painful.

No discernible body fat and an obvious loss of muscle mass). The dog has generalized severe muscle wastage and is emaciated. The longer coat hides the extent of emaciation, which is obvious on palpation.<br><br>Overall appearance and attitude - Dog is slightly nervous and tense on examination. Not eager to interact with people.<br>Hydration - normal |

EYES - WNL  
 Mucous membranes: pink CRT: <2s  
 Nose - no lesions or discharge present.  
 Mouth - Mild tartar build up on all canines, no oral ulcerations.  
 Chest - No heart murmur or arrhythmia on auscultation, lung sounds clear in all fields.  
 Abdomen - Comfortable on palpation, no obvious masses. Mammary tissue development present suggesting dog has whelped at least one litter, not currently lactating.  
 Urogenital system - WNL  
 Skin - No obvious skin lesions.  
 Coat - Poor coat condition. Coat is dull in appearance and has an oily texture. Mud/dirt and fecal matter on outside surface of both thighs. General foul odour present.  
 Nails: Nails on both front feet moderately overgrown.  
 Musculoskeletal: Ambulatory on all 4 limbs, no obvious signs of lameness. Increased hock flexion (laxity) in both HLs seen when standing, leading to an almost plantigrade stance. Hips have slightly decreased range of motion through extension however the dog is tense and nervous on examination so may not be an indicator of pain.  
 Ringworm culture required: No  
 Lymph nodes - WNL  
 Neurological - WNL

Urine scalding: No  
 Urine staining: No  
 Faecal staining: Yes

Assessment/differential diagnoses:  
 Emaciation/muscle wastage ddx: chronic and severe malnutrition, parasitism, chronic disease (e.g. neoplasia, protein losing enteropathy/nephropathy, endocrine)

Statement regarding animals' pain and distress upon arrival at SPCA:  
 Distress/suffering level: Chronic & Severe  
 Source of distress/suffering: Emaciation/starvation

Controlled by treatment: Yes - feeding. As emaciated will need gradual increase in caloric intake.

Behavioural distress and symptoms: Shy, not eager to interact with people.

Diagnostic tests performed:  
 -Blood work (CBC and biochemistry) sent to Gribbles lab.  
 -Fecal sample sent to Gribbles lab.  
 -Will need general anaesthetic for elbow and hip radiographs when is closer to a more normal body condition score, in order to minimise the anaesthetic risk.

Treatment (Medications/procedures/surgery):  
 Dog was vaccinated with Vanguard +5 and Vanguard Oral Bordetella.  
 Dronal and Simparica administered following sampling of faeces.  
 Feeding plan: Gradual increase to RER (70+(BWx30)) over 7 days. Her total daily amount should be spread over 4 feeds. After the first week, daily calories can be slowly increased by 10-15% to allow repletion of lean body mass. At 24kg, Xena's RER is 790kcal/day, which is approximately 2 cups of Purina SmartBlend Chicken and Rice per day.

Vanguard CC B Orali  
 Bordetella Bronchiseptica

@COMMENTS

VETERINARY INTERPRETATION:

Hi Senka. Mild hypoalbuminemia can be seen with acute inflammation, decreased protein intake, or with protein loss (ex. parasitism, blood loss, etc.). Hypocalcemia can be seen with decreased intake, poor GI absorption, fluid diuresis, or acute pancreatitis.

Additional results to follow.

Julie Tomlinson, BS, DVM, Diplomate ACVP (Clin. Path), Registered Specialist in Veterinary Clinical Pathology

@COMMENTS  
False negative results can be seen with aged samples, low parasite burden, early infections, and intermittent shedding. A fecal centrifugation/flotation test is more sensitive than a FEC for detecting low numbers of parasite ova/oocysts in small animals

Opinions and interpretations of test results expressed in this report are outside the scope of the laboratory's terms of accreditation.

@COMMENTS

RBCs- Anisocytosis 1+ Poikilocytes 2+ Acanthocytes 1+  
Leukocyte morphology appears normal.  
Platelets are clumped in the film, Platelet numbers appear mildly increased.  
\*\* Thanks for sending a fresh film \*\* PM

VETERINARY INTERPRETATION:

HCT is trending low which can be seen with chronic/inflammatory disease as well as with chronic low grade blood loss (ex. hookworm or flea infestation). A few bands are noted which can be seen with inflammation, as can thrombocytosis.
